Slavic Across-the-Board Constructions with the Respective Reading

This talk is concerned with across-the-board (ATB) constructions in which the ATB-moved element is interpreted as referentially non-identical in each of the conjuncts. It discusses existing approaches to this phenomenon, points to their shortcomings, and proposes an ATB analysis with multiple movements and subsequent ellipsis. It is argued that the movement chains are independent, that TPs – not CPs – are conjoined and that the ellipsis operation is based on the distinctness requirement on linearization.
